This CDS clone is a part of a collection of human full length
expression clones generated by BD Biosciences Clontech and the
Harvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the Sall and Hindill sites of the pDNR-DUAL
vector. Additional sequences in the clone: 'ACC' after Sall site
and before 'Hid III site to maintain reading frame.
Clone distribution: http://bioinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /codon_start=1

expression clones generated by BD Blosciences Clontech and the
farvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tags). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the Sall and HindIII sites of the pDNR-DUAL
vector. Additional sequences in the clone: 'ACC' after Sall site
and before 'ATG' to provide Kozak consensus sequence; 'GG' after
clone distribution: http://bioinfo.clontech.com/orfclones.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

/SIDS1/gcgdata/geneseq/genesegn-emb1/NA2003.DAT:

'gcgdata/geneseg/genesegn-embl/NA2002.DAT

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                           This invention describes a novel human prostate-derived serine protease (PDSP) polynucleotide (also known as Tango 114). The prostate derived serine protease (PDSP) polypeptide is used to modulate a variety of cellular processes. It can used to produce fusion proteins. PDSP is used to treat proliferative disorders, e.g. prostate cancer. The protein may also be used to produce antibodies, e.g. prostate cancer. The protein may can be used to produce antibodies, and to identify antagonists and antibodies can be used in Screening assays; predictive medicine; and methods of treatment. PDSP cleaves growth factors, and can be used for the modulation of growth factors blosynthesis; generation of active peptides, regulation of growth factor blosynthesis; generation of growth factor blosynthesis; generation; regulation of callular proliferation; development. The PDSP claudiation of proteins regulation of prostate development. The PDSP contestasis and regulation of prostate development. The PDSP collunctedides can be used to express the protein; to detect PDSP mRNA; to detect genetic alterations in the PDSP gene; in forensic biology; and solve protease and probes. As serine protease have important coles in cellular processes, there exists a need for identifying novel serine protease such as the prostate derived serine protease (PDSP) of the invention. This sequence encodes the human PDSP-1 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target
The invention relates to a method of detecting the presence of a target
SS247 polynucleotide, especially mRNA, in a test sample. BS247
polynucleotides are derived from breast tissue. The polynucleotides,
polynucleotides are useful for providing information leading
to the detection, diagnosis, staging, monitoring, presponsis, in vivo
imaging, prevention or treatment, determining predisposition to, diseases
and conditions of the breast, such as breast cancer, atypical
on therapy for breast cancer, can be based on these identified gene
sequences and the efficacy of any particular therapy can be monitored.
The BS247-derived reagents are advantageous for detection of breast
cancer due to their specificity. The reagents also provide an
alternative, non-surgical diagnostic method capable of detecting early
stage breast disease, such as cancer.

                                                                                                                                                                         ò
                                                                This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target BS247 polynucleotide, especially mRNA, in a test sample. BS247 polynucleotides are derived from breast tissue. The polynucleotides, polynucleotides are derived from breast tissue. The polynucleotides, polynucleotides are useful for providing information leading to the detection, diagnosis, staging, monitoring, prognosis, in vivo imaging, prevention or treatment, determining predisposition to, diseases and conditions of the breast, such as breast cancer, atypical hyperplasia, fibroadenoma and cystic breast disease. Drug treatment or gene therapy for breast cancer, can be based on these identified gene sequences and the efficacy of any particular therapy can be monitored. The BS247-derived reagents are advantageous for detection of breast cancer due to their specificity. The reagents also provide an alternative, non-surgical diagnostic method capable of detecting early stage breast disease, such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GlnAlaAlaLeuLeuLeuArgProAsnGlnLeuTyrCysGlyAlaValLeuValHisPro 100

The gene number is given in the descriptor line. The gene can be used to generate fuusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. Aa206210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: Aa206219-20653; amino acid sequences AA208386-Y38498) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypucleotides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 36 human and a sample or by determining the presence of mutations in the new polypucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polynucleotides, based on which tissues they are most highly expressed (see AA206219 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human genes and the secreted polypeptides they encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1381 BP; 329 A; 425 C; 353 G; 274 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This DNA encodes a human keratinocyte derived protease (KDP) polypeptidd The protease is substantially similar to a sequence encoded by the inset in plasmid FERM BP-6129. The KDP polypeptide, from human keratinocytes, is specifically used in skin care products, particularly to treat or prevent skin flaking, e.g. dandruff, and in laundry detergent compositions. More generally the KDP polypeptide can be used in any cleaning composition, e.g. hard surface or dishwashing products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GlnAlaAlaLeuLeuLeuArgProAsnGlnLeuTyrCysGlyAlaValLeuValHisPro

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AA206210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: AA206219-206263; amino acid sequences AAX06219-206263; amino acid sequences AAX08386-Y38498) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypurcleotides. Specific uses are described for each of the 36 polymorleotides. based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The prostate derived serine protease (PDSP) polypeptide is used to modulate a variety of cellular processes. It can used to produce fusion proteins. PDSP is used to treat proliferative disorders, e.g. prostate cancer. The protein may also be used to produce antibodies, and to identify antagonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel prostate derived serine protease polynucleotides and polypeptides used to modulate cellular processes \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            783
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   903
          can be used in screening assays; predictive medicine; and methods of treatment. PDSP cleaves growth factors, and can be used for the modulation of growth factor biosynthesis; generation of active peptides; regulation of cellular proliferation; degradation of growth factor binding proteins; regulation of cellular differentiation; regulation of prostate development. The PDSP polynucleotides can be used to express the protein; to detect genetic alterations in the PDSP gene; in forensic biology; and as a source of primers and probes. As serine protease have important roles in cellular processes, there exists a need for identifying novel serine protease such as the prostate derived serine protease (PDSP) of the invention. This sequence encodes the human PDSP-1 described in the
 homologs and antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor immunoadhesins, for instance, can be used as therapeutic agents the acceptor-immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences but also be useful for the preparation of PRO polypeptides, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                413

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAS21244-AAS21518 encode for novel human secretory and transmembrane
PRO polypeptides. The PRO polypeptides are useful to detect other
PRO polypeptides, to link bloactive molecules to cells expressing
PRO polypeptides, to modulate biological activities of cells expressing
PRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
Dolypeptide expression in a cell sample to that in a control sample.
Come of the 275 sequences are also useful to stimulate the release of
tumour necrosis factor-alpha (TNF-alpha) from human blood, the
proliferation or differentiation of chondrocytes, the proliferation or
gene expression in periorte cells, the release of proteoglycans from
cartilage, the proliferation of inner ear utricular supporting cells or
of T-lymphocytes, the release of a cytokine from peripheral blood
monocytes (PBMCs), or the proliferation of endothelial cells. Some of
the PRO polypeptides may modulate glucose or free fatty acid uptake by
skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide
to factor VIIA. The PRO polypeptides can be used in assays to identify
molecules involved in binding interactions. The polynucleotides encoding
PRO polypeptides can be used to generate probes, antisense RNA/DNA,
transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gao W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bloactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical

                                                                                                                                                                                                                         ò
                  The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inking bloactive molecules to cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The PRO polypeptides are useful for for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating presence of tumours. The prolynucleotide sequences encoding PRO polypeptides are useful as hypidistation probes, in chromosome and presence of tumours. The polynucleotide sequences encoding PRO polypeptides are useful as hypidistation probes, in chromosome and presence of tumours. The polynucleotide sequences encoding PRO polypeptides are useful as hypidistation probes, in chromosome and preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the genetic analysis of individuals with genetic disorders, and in gene therapy. ACA03603-ACA03877 represent cDNAs encoding the human PRO polypeptides of the invention.

Note: The sequence data for this patent was obtained in electronic sequata uspto.gov/psipsDIDEntry.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      533

```
The invention relates to an isolated nucleic acid comprising, or which is at least 80% identical to, or the full-length coding sequence of, any of the 275 nucleotide sequences, encoding the corresponding PRO polypeptide (one of 275 secreted or transmembrane proteins). The nucleic acid further comprises the full-length coding sequence of the DNA deposited cunder American Type Culture Collection (ATCC) accession number in a list given in the specification. Also included are vectors and host calls for producing PRO proteins, PRO fusion proteins, anti-PRO antibodies, PRO extracellular domains and mature sequences, methods of detecting PRO proteins, methods for stimulating the release of TNF-alpha (tumour necrosis factor alpha) from human blood, (and the proliferation of differentiation of chondrocyte cells, the release of proliferation of, or gene expression in pericyte cells, the release or proteoglycans from cartilage, proliferation of inner ear urticular supporting cells, the proliferation of T-lymphocyte cells, the release of a cytokine from peripheral blood mononuclear cells, the release of proliferation of endothelial cells), a method for modulating the uptake of glucose or free fatty acid (FFA) by skeletal muscle cells, or the differentiation of adippocyte cells, a method for modulating the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the proliferation of adippocyte cells, a method for detecting the problem and of the differentiation of adippocyte cells, a method for detecting the problem and gene mapping, and in generating antisense RNA probebs, in chromosome and gene mapping, and in generating antisense RNA probebs, or bNA The p

3 Gao Filvaroff E, Ga L, Sherwood S; od WI, Zhang Z; Deforge L, Desnoyers L, Filvar A, Godowski PJ, Gurney AL, She Tumas D, Watanabe CK, Wood WI, Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in consuperative molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus constain cardiac insufficiency disorders. PRO154 and PRO1186 stimulate adrenal cortical capillary endothelial growth, and PRO536, PRO943, PRO943, PRO826, PRO1068 or PRO535, PRO826, PRO1367 induce crics in endothelial growth, and are thus useful for treating conditions or disorders where angiogenesis would be cheficial, e.g. wound healing and antagonist of this polypeptide are useful for treating conditions tumours. PRO812 inhibits vascular cells useful for treating conditions tumours. PRO812 inhibits vascular cells and is thus useful for inhibiting endothelial cell growth in mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO1068, PRO1184, PRO1346 and are this polypeptide are cells and is thus useful for inhibiting endothelial cell growth in mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO1068, PRO1068, PRO1184, PRO1346 and PRO1375 stimulated proliferation of stimulated T-lymphocytes and are therapeutically useful for rehancing immune response. PRO828, PRO826, PRO1068 or PRO1132 enhance survival portiferation of disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO819, PRO813 cand therefore are useful for treating kidney disorders associated with dermatitis, herpetiformis or conherced and PRO1312, pRO1192 and PRO1310, pRO814, PRO81312, PRO1312, and PRO8131, induce the complication and/or redifferentiation of chondrocytes in culture and ere thus useful for treating sports injuries, and arthritis. This

Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer treatments

Example 99; Page 259; 648pp; English.

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO
